François Tilmant has been working on the development of hydrological models at INRAE since 2018. A graduate of IMT Mines Albi and Toulouse INP, he began his career as a hydrology modeler. After gaining experience in engineering consultancies and a water agency, he joined the team as a hydroinformatician. He is responsible for developing the GRP flood forecasting software, which is widely used by the national flood forecasting services. He is also in charge of the developments of the low-flow forecasting platform PREMHYCE. He regularly leads meetings of the user groups for these two modeling tools.
